

Spectral-block CV + R^2_{gap} + eigenvector energy (Gemini r6)

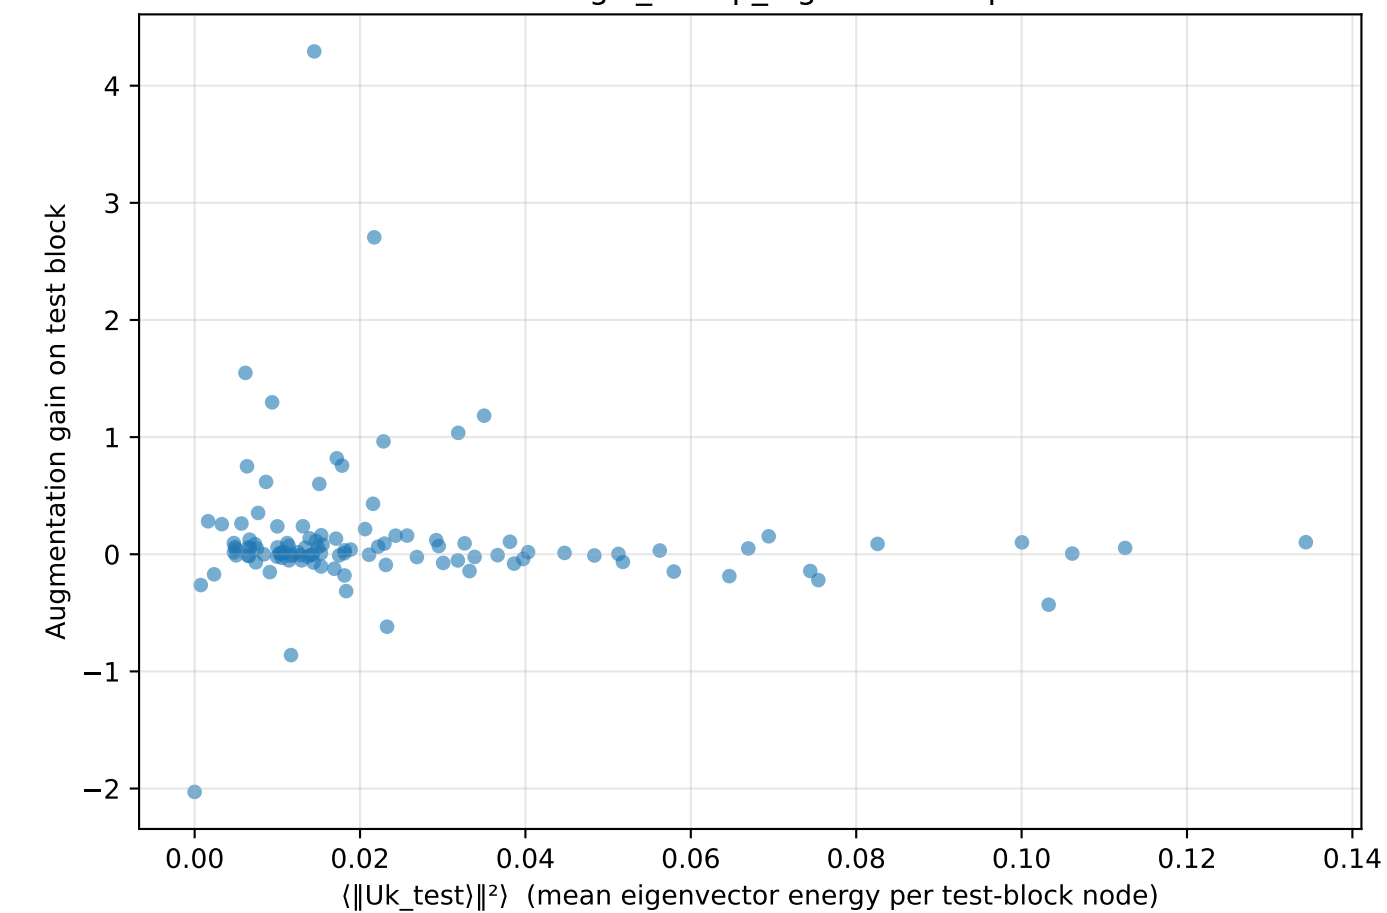

(a) H1b under spectral-block CV ($z > -5$)
 $\beta = -0.1956$ $p = \text{nan}$ $n = 11$

(b) Dirichlet predicts the leakage gap
 $\beta = -1.295$ $p = 0.1015$ $R^2 = 0.33$

(c) Mechanism: eigenvector reach on test block
after controlling z_{kde} : $\beta_{\text{eig}} = -0.0389$ $p = 0.6522$

(d) The illusion of interpolation vs the reality of extrapolation
